

# Becky's Dog Walking Parasite Treatment Program

**We recommend Bravecto Chews for Fleas and Ticks, and Drontal for Worms**

When fleas and ticks feed, they take in Bravecto and die. Bravecto Chew for Dogs starts to kill fleas after 2 hours and provides effective control within 8 hours for fleas and within 24 hours of attachment for ticks. Bravecto Chew for Dogs controls flea infestations for 3 months and paralysis ticks for 4 months.

Drontal is recommended for the control of all gastrointestinal worms in dogs including roundworm, hookworm, whipworm and tapeworm. Drontal is a formulation of three distinctly different proven drugs offering the broadest spectrum of activity.

## Price by Product Only

Product	Price (inc. GST)
Drontal Worming per 10kg	\$7

20 - 40kg	\$103
40 - 56kg	\$127

**For the price of the just the products, you get a Nurse administered, 3-monthly managed parasite treatment program free!**

We recommend keeping your puppies on flea and tick protection all year round. Your dogs can be exposed to fleas and ticks in social settings such as Doggie parks, grooming facilities, cats at home, kennels, and day cares. It only takes one animal carrying one flea or tick to spread.

### Fleas

One flea can be brought into your home on you, or your pet. That one flea can cause a flea infestation. In Winter, cold temperatures don't kill fleas or their eggs. They do, however, slow the life cycle down. Fleas can survive outdoors in temperatures as low as 0oC degrees for five days, plenty of time for them to come into your home and get nice and warm. Flea eggs can live all year round in protected areas such as garages, crawl spaces, and porches.

### Ticks

Ticks generally thrive in warmer, moist environments but struggle to survive if it is too hot and dry. All life stages need a blood meal, so you need to be alert for ticks year-round. During the colder months, when we have a warm or mild day, we take our pets out to enjoy it, exposing them to ticks in the environment.
